

Week 1 Report: Superstore Sales Data Import, Power Query & Data Cleaning

Introduction

In this week, I worked with the Superstore Sales dataset using Power BI Desktop. The main goal was to learn how to import the data, clean it, and prepare it for analysis. Data cleaning is important because the data should be correct, clear, and well-organized before creating reports and dashboards. The dataset contains information about sales, customers, products, regions, and profit. By cleaning and preparing the data, I created a good base for the next stages of my Power BI project.

Step 1: Importing Data into Power BI

I opened Power BI Desktop and selected the option to import data from a CSV file.

I successfully loaded the Superstore dataset into Power BI and checked it in Report View, Data View, and Model View.

These three views helped me understand the dataset:

Report View is used to create and view charts and other visuals.

Data View is used to see the actual rows and columns.

Model View is used to see the relationships between tables.

This helped me understand the structure of the dataset.

Step 2: Checking Data in Power Query Editor

I opened the Power Query Editor to check the dataset.

I checked the data type of each column, such as text, number, and date.

I checked for missing or blank values.

I also checked whether there were any duplicate records.

This helped me understand what changes were needed to clean the data.

Changed Type with Locale1

Step 3: Column Transformations

I made some changes to the columns to make the data easier to use.

- I renamed some columns to make their names clearer.
 - Split text fields where necessary (for example, separating combined information).
 - I removed extra spaces from text values.
 - Changed data types so that numbers, dates, and text were properly recognized.
- These changes made the dataset cleaner and easier to understand.

= Table.TransformColumnTypes(#"Changed Type with Locale", {{

Step 4: Standardizing Categorical Data

I worked with categories such as Category, Sub-Category, and Segment.

I made sure that the text values were written in a consistent format.

This is important because different formats can cause problems when filtering or grouping the data.

After this step, the categories were more consistent and ready for reporting.

AB	C Product Name	12	Sales	123	Quantity

	4009 Highlighters by Sanford			19.9	
	Avery Metallic Poly Binding			3.438	

Step 5: Creating Date Columns

From the Order Date column, I created different date-related columns.

Year ? to check sales for each year.

Quarter ? to compare sales in different quarters.

Month ? to compare monthly sales.

Day ? to check daily sales.

Day of Week ? to find which days had more sales.

I used Power Query and M code to create these columns.

These columns will help me study sales trends and changes over time.

Step 6: Loading the Clean Data Model

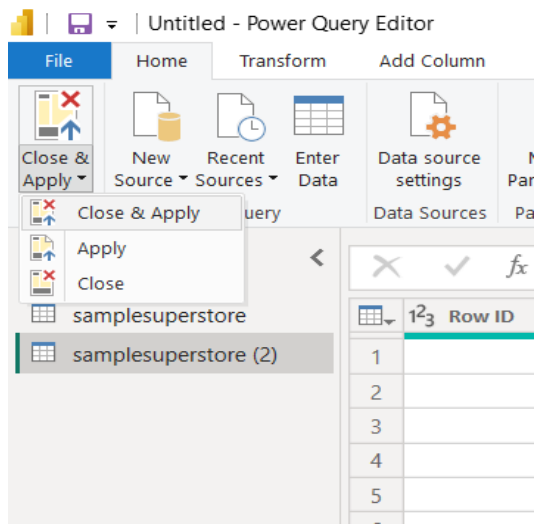

After completing all the changes, I selected Close & Apply in Power Query.

The cleaned data was loaded back into Power BI.

I checked the Data View to make sure the new columns and corrected values were available.

The dataset was now ready to create dashboards and perform further analysis.

Deliverables:

A clean and transformed dataset in Power BI.

Screenshots showing each step: importing data, cleaning in Power Query, column transformations, date extraction, and final model.

A prepared data model that can be used for analyzing customer purchases, product categories, regional performance, and profitability.

Conclusion:

This week's work helped me understand the importance of data cleaning in Power BI. I learned how to import the Superstore dataset, check the data, make changes using Power Query, and create useful date columns. After completing these steps, the data became clean, organized, and ready for analysis. This will help me create dashboards and find useful information from the data in the upcoming weeks.
